Agile and Cognitive Cloud-edge Continuum management (AC³)

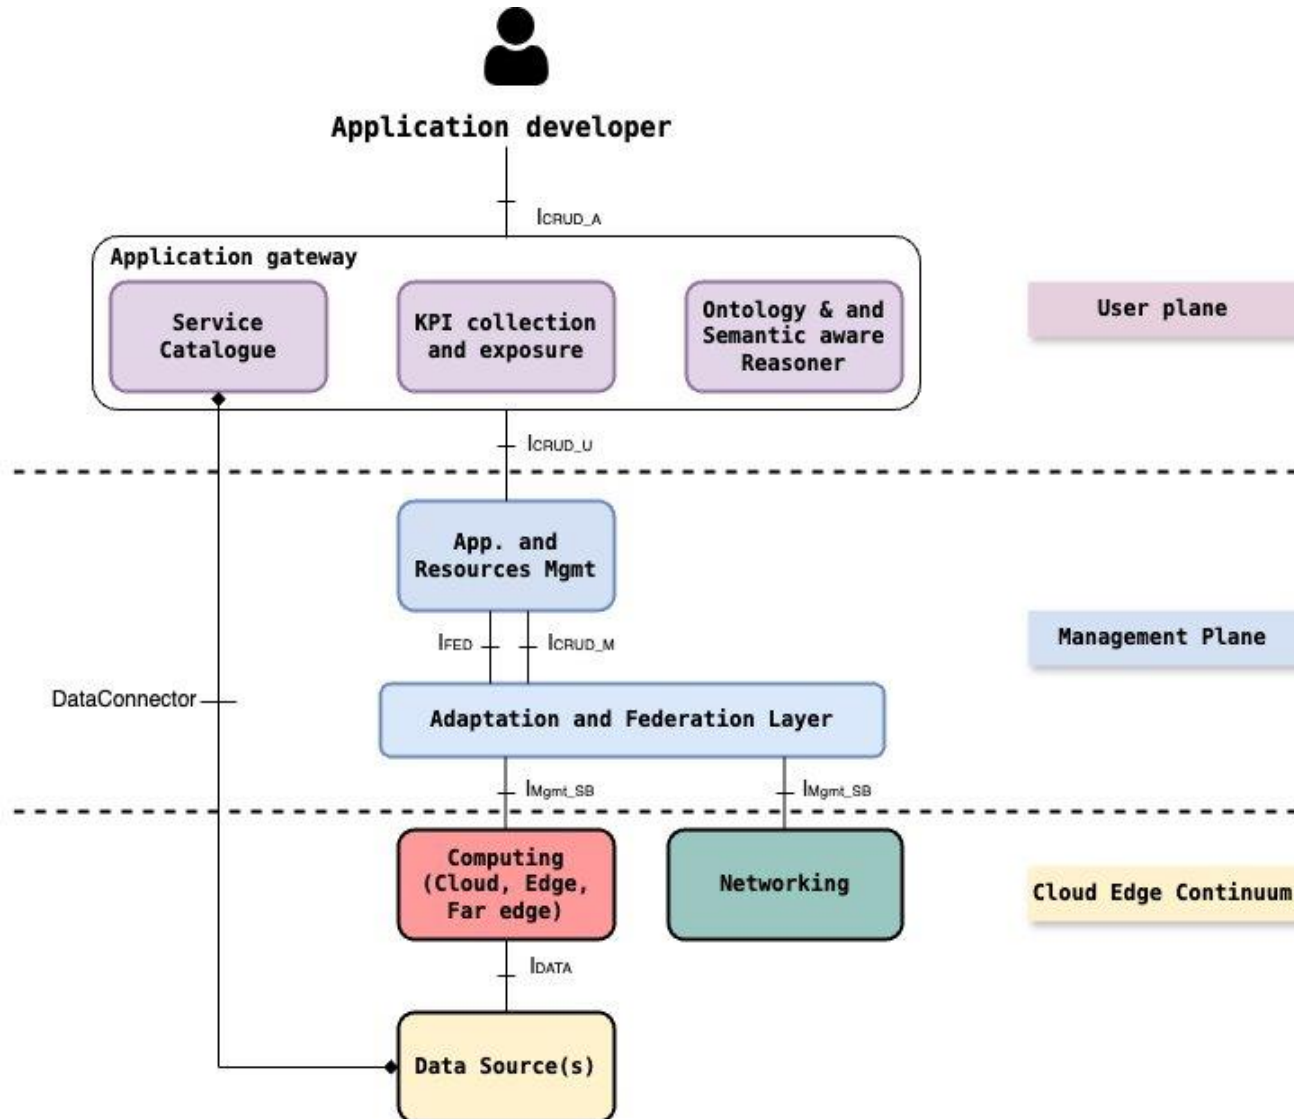

NexusForum 2024

Sara Madariaga

Brussels, 20th September 2024

Design, develop, and evaluate a Cloud Edge Continuum Computing Manager (CECCM) featuring AI/ML and XAI to:

- Handle Life Cycle Management of new application models (micro-service-based) by redefining SLA, predicting application profile, and describing micro-services using a semantic-aware solution, while guaranteeing the application's SLA.
- Handle Cloud Edge Continuum (CEC) infrastructure, including far-edge resources, by defining novel stateful service migration, resource scaling, and energy consumption optimization, while guaranteeing balance between resource infrastructure and application SLA.
- Use a programmable network connecting the CEC computing nodes to enforce intra-micro-service communication Quality of Service (QoS).

- Architecture based on 3 planes.
- OSR to describe the micro-service-based applications considering inputs from the developer.
- AI/ML-based algorithms to handle the LCM of applications: application profiles, stateful container migration, XAI-based resource management.
- Programmable SD-WAN to interconnect computing nodes from different regions and operators.
- Data management PaaS based on Gaia-X and IDS approaches using connectors (EDC) and catalog (Piveau).
- Enablers such as monitoring, resource discovery and exposure, GUI for the application developer.
- Trust framework at resource federation level based on smart contracts to guarantee SLA.
- Security based on zero-trust, even between the components of the CECCM.

IoT and data

- Showcase an IoT-based, self-operating, smart sensing and monitoring framework based on AC³.
- Optimize data processing locations dynamically, balancing edge response and cloud computational power.
- Deployment comprised of different sensors (CO₂, air quality, human presence) and Raspberry Pi devices.
- Data to train custom ML models used for forecasting data trends and detecting anomalies.

UAV Monitoring System

- Real-time monitoring and generation of actionable insights from video streams and environmental sensor data.
- Demonstrate the CECCM flexibility to change application behaviour (object tracking, movement prediction, surveillance, unusual activity detection).
- Demonstrate the CECCM capability to deploy and run micro-services on far edge (UAV), anticipate node unavailability and migrate micro-services accordingly.

Deciphering the universe

- Showcase the adequacy of the CECCM to process hundreds of TBs of astronomy data (3D datacubes).
- Develop a microservice-based application to distribute software and data across the federated infrastructure.
- Optimize the execution of data intensive applications through the federation layer.
- Maximize the use of local bandwidth, reducing end-to-end execution times.

Thank You!!!

aerOS Slides

[Date]

[Presenter]

aerOS: CONTEXT AND ORIGINS

The **unprecedented data explosion** and the evolving capabilities of **virtual infrastructures**, set the scene for developing a **new paradigm** for **data** and **compute resource** management in EU

Processing needs to be performed **closer to the data sources** (often smart devices), in an effort to minimise latency, save bandwidth, improve security, guarantee privacy and increase autonomy

CHALLENGES

- Wide variety of deployment models and open standards
- Existing legacy investments

The challenge of seamlessly integrating various edge technologies into a homogeneous "continuum" remains open

- Cloud centricity and cost
- Network management
- All-around virtualisation
- Security & trust

Main innovation, goal and use cases

- ...using context-awareness to distribute software task (application) execution requests
- ...supporting intelligence as close to the events as possible
- ...supporting execution of services using “abstract resources” (e.g., virtual machines, containers) connected through a smart network infrastructure
- ...allocating and orchestrating abstract resources, responsible for executing service chain(s)
- ...supporting scalable data autonomy

aerOS overarching goal is to design and build a virtualised, platform-agnostic meta operating system for the IoT edge-cloud continuum. As a solution, to be executed on any Infrastructure Element within the IoT edge-cloud continuum – hence, independent from underlying hardware and operating system(s)

 **Manufacturing:** Data-Driven Cognitive Production Lines (Manufacturing Autonomy Level 4 – MAL4)

 **Renewable energy:** Containerised Edge Computing near Renewable Energy Sources

 **Machinery:** High Performance Computing Platform for Connected and Cooperative Agricultural Mobile Machinery to Enable CO2 Neutral Farming (HPCP-F)

 **Maritime ports:** Smart edge services for the Port Continuum

 **Smart Buildings:** Energy Efficient, Health Safe & Sustainable Smart Buildings

Liaison with the CSA EUCloudEdgeloT Continuum (EUCEI)

ACTIVE CONTRIBUTION to actions organised by EUCEI

Pitches and events

- TF3 Toulouse Technical Meeting
- Capitalising on EUCloudEdgeloT
- EBDVF 2023 (Valencia)
- Concertation & Consultation meeting – May 2023

Via aerOS strategic pilots

One pitch in each sector targeted-webinar:

- Energy: [Nov 2023](#)
- Agriculture: [Feb. 2024](#)
- Manufacturing: [July 2023](#)
- Transportation: [March 2023](#)

Reports

- Landscape of projects
- Whitepaper on Architecture
- Demand skills
- Feasibility Tool for Adoption
- Meta OS use cases

DIRECT ACTIONS organised or co-organised by aerOS

Impact-wise

- Open Call webinars (6)
- 7 publications in EUCEI webpage

At the core of the CSA

- Workshop “*Meta Operating Systems: Innovating the CEI landscape*”
- UPV leads **WG5 of TF3 Architecture** (Orchestration)
- ISO/IEC SC41/JTC1 Workshop (Helsinki)

Scientific

- IEEE CloudNet 2023 (NY)
- MECC 2024 (Athens)

What have we learnt?

- **Common ideas** are shared among projects:
 - Virtualized/containerized services
 - Cloud-native principles as baseline
 - We cannot deny the relevance of current cloud technologies – we must adapt and differentiate
 - Multi-layer orchestration
- Some technical areas intertwine
- aerOS is working in key, strategic sectors
- **Cross-communication is effective** (especially with a single window approach).
- Issues with Open Call preparation have been shared fruitfully.

... and much more events & lessons to come.

aerOS project @AerosProject · 18 jul.
#LearnaboutaerOS: aerOS partners took part at the "Cloud-Edge-IoT Innovations in #Manufacturing: Unveiling Market Insights and Use Cases" which took place on July 10th in collaboration with @EU_CloudEdgeIoT and @Fluidosproject.
@DigitalEU @UPV @HorizonEU

The screenshot shows a presentation slide titled "aerOS Manufacturing Use Case - METROLOGY". It includes the aerOS logo and a list of 3 scenarios: 1. Green manufacturing (non-woven) and CO2 footprint monitoring, 2. Automotive Smart Factory Zero Defect Manufacturing, and 3. AGV smart navigation. It also mentions a challenge in the measurement process and includes a small video feed of a person.

Countries

Context

Why is INPACE important?

1

The **EU aims to strengthen its connection to the Indo-Pacific region** for research, innovation, technology deployment, regulation alignment, and supply chain stability.

2

Promotion of digital technologies being one of the highest priorities, the EU has established Digital Partnerships with Japan (2022), the Republic of Korea (2022) and Singapore (2023), and a Trade and Technology Council (2022) with India.

3

The goal is that society and businesses in both regions **benefit from opportunities in the growing global digital economy**

Mission

What is INPACE aiming to achieve?

The mission of INPACE is to **support digital partnerships and the Trade and Technology Council** and to contribute to the deepening of the **collaboration between Europe and India, Japan, the Republic of Korea and Singapore** in the domain of digital technologies and their application for the well-being of the citizens in Europe and in the Indo-Pacific region.

To achieve this mission, INPACE will work on three levels:

Establishing **regular exchanges between leading experts from Europe and the four partner countries** on policies, further developments of key digital technologies, and their implementation and commercialization.

Supporting the **digital policy dialogues on the governmental and institutional level** and the implementation of the Digital Partnerships and the Trade and Technology Council.

Informing and involving a large community of stakeholders in Europe and in the partner countries into the **dialogues via online and in-presence events and via the INPACE Community Platform**.

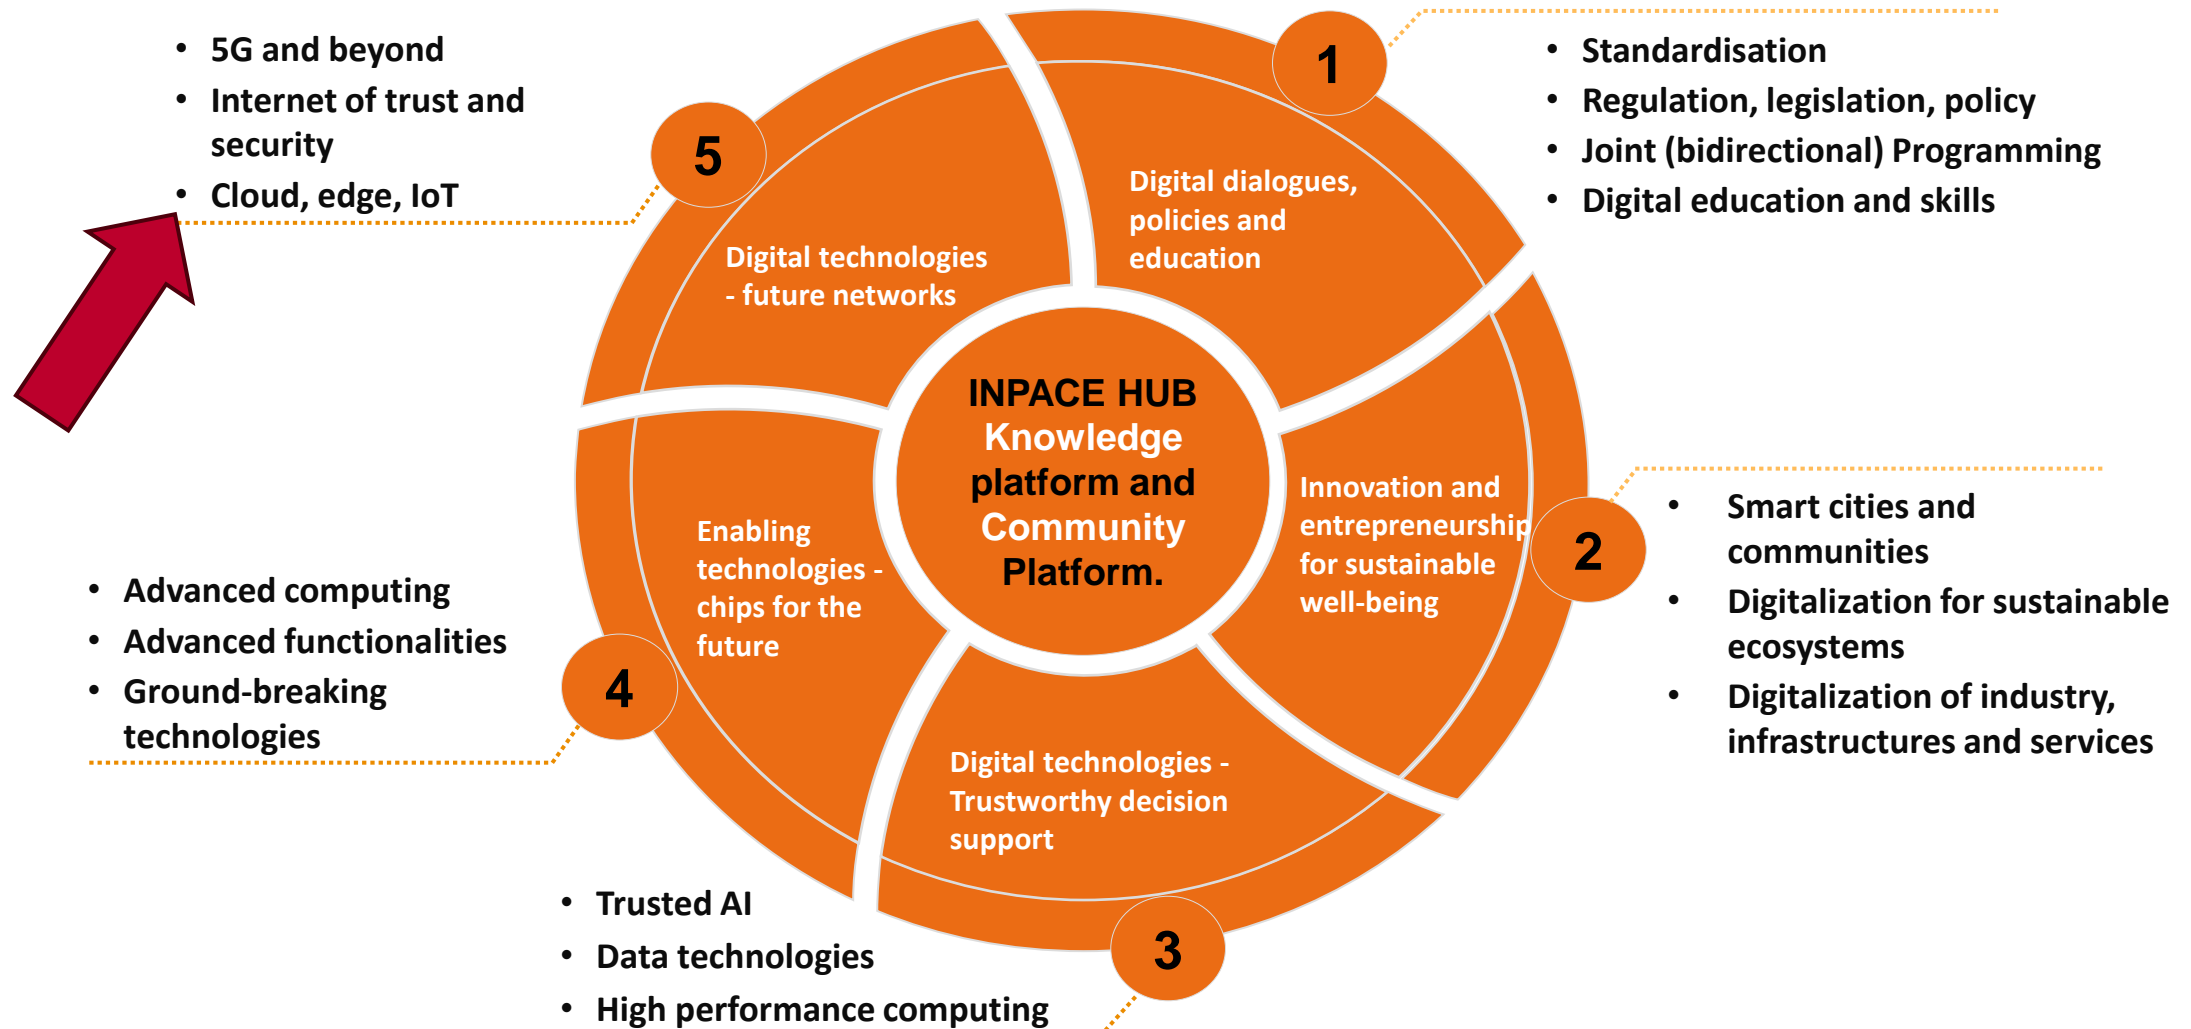

Thematic Working Groups

INPACE organises exchanges through Thematic Working Groups that bring together **experts from industry, associations, government institutions and the research communities** from the partner countries and Europe.

Their mission is to foster **joint research and innovation, business collaboration, market opening, policies collaboration**, and to support the implementation of the Digital Partnerships and the Trade and Technology Council with the partner countries.

Trustworthy and Resilient Decentralised Intelligence for Edge Systems

João Leitão

NOVA University of Lisbon

NexusForum.Eu

Brussels, September 2024

TaRDIS aims at simplifying the development, operation, and resilience of emerging Swarm applications being a driver for innovation.

TaRDIS aims at simplifying the development, operation, and resilience of emerging Swarm applications being a driver for innovation.

A Swarm is a distributed system composed of many, potentially, heterogeneous (hardware and software) nodes that cooperate in a highly autonomous way to achieve a common goal.

TaRDIS aims at simplifying the development, operation, and resilience of emerging Swarm applications being a driver for innovation.

A Swarm is a distributed system composed of many, potentially, heterogeneous (hardware and software)¹ nodes that cooperate in a highly autonomous way to achieve a common goal.

¹ This not only implies that devices in the swarm might have different amounts of computational resources, but they might even have different architectures, capabilities, or roles. The application logic running on each device might be different because of that.

TaRDIS aims at simplifying the development, operation, and resilience of emerging Swarm applications being a driver for innovation.

A Swarm is a distributed system composed of many, potentially, heterogeneous (hardware and software) nodes that cooperate in a highly autonomous² way to achieve a common goal.

² Implies avoiding centralised control components and human intervention to manage the system operating and to allow it to evolve (e.g., grow in number of node in the swarm).

Key Result: The Babel Ecosystem

Babel is a java framework that simplifies the development of distributed abstractions (i.e., protocols) and systems.

- Event driven programming model.
- Leverages java inheritance to enforce a programming discipline.
- Shields developers from complex concurrency issues.
- Abstracts low level aspects in system and protocol development.

Babel: A Framework for Developing Performant and Dependable Distributed Protocols.

EMPYREAN – Vision and Concept

- ❑ EMPYREAN envisions a **collaborative** autonomous computing ecosystem over heterogeneous resources, different providers and connectivity types.
- ❑ EMPYREAN will build **federations** of collaborative resources, the **Associations**.
- ❑ Association provides a secure execution environment, coupled with identity and access mechanisms.
- ❑ Associations form the control & management plane, operating in autonomous, cognitive, AI-driven manner.
- ❑ Association-based continuum will balance computing tasks and data locally inside an Association as well as between federated Associations.
- ❑ EMPYREAN platform will provide:
 - decentralized security & privacy, secure distributed edge storage, IoT-edge interconnection, efficient data processing of ML-workloads, cognitive operation, AI-augmented application development & deployment, energy-aware orchestration
- ❑ EMPYREAN includes 3 UCs in: (i) advanced manufacturing, (ii) smart agriculture, (iii) warehouse automation:
 - High-demanding, safety-critical, dynamic, applications that include IoT devices, robots, drones, equipped with cameras and sensors

Expected Impact

- ❑ EMPYREAN's Associations will enable European entities, to make their own choices, regarding data processing and storage.
- ❑ EMPYREAN's unique technological advancements and their application in key sectors will contribute towards the realization of Europe's digital and industry related targets.
- ❑ EMPYREAN is committed to promote software interoperability and portability, realizing an EMPYREAN open ecosystem based on Associations.
- ❑ EMPYREAN partners will promote the strategic industrial cooperation in AI/ML-based data storage and processing that can benefit the EU industry in the global IoT-edge-cloud service markets.

The Vision of the Cognitive Computing Continuum: The CoGNETs approach

Presenter: Georgios Spanos

Affiliation: Centre for Research and Technology Hellas

Date: 20/09/2024

Location: Brussels, Belgium

**Funded by
the European Union**

Schweizerische Eidgenossenschaft
Confédération suisse
Confederazione Svizzera
Confederaziun svizra

Swiss Confederation

Federal Department of Economic Affairs,
Education and Research EAER
**State Secretariat for Education,
Research and Innovation SERI**

Grant Agreement
No 101135930

Vision

CoGNETs aims to develop a **Middleware Framework** that will empower **IoT, Edge, and Cloud** devices to autonomously organizing dynamic **IoT-to-Cloud swarm continuums** for optimal data processing and seamless service provisioning

To enable operation of continuums with no fixed orientations shifting to an on-demand opportunistic approach targeting to “**dynamic swarm continuums**”

To promote “**self-organization**” and “**collaborative-learning**” of devices, **Asymmetric Multi-Player Competitive Games**, containing self-organizing “Pricing”, “Bidding”, and “Auctioning” properties, are introduced

Concept

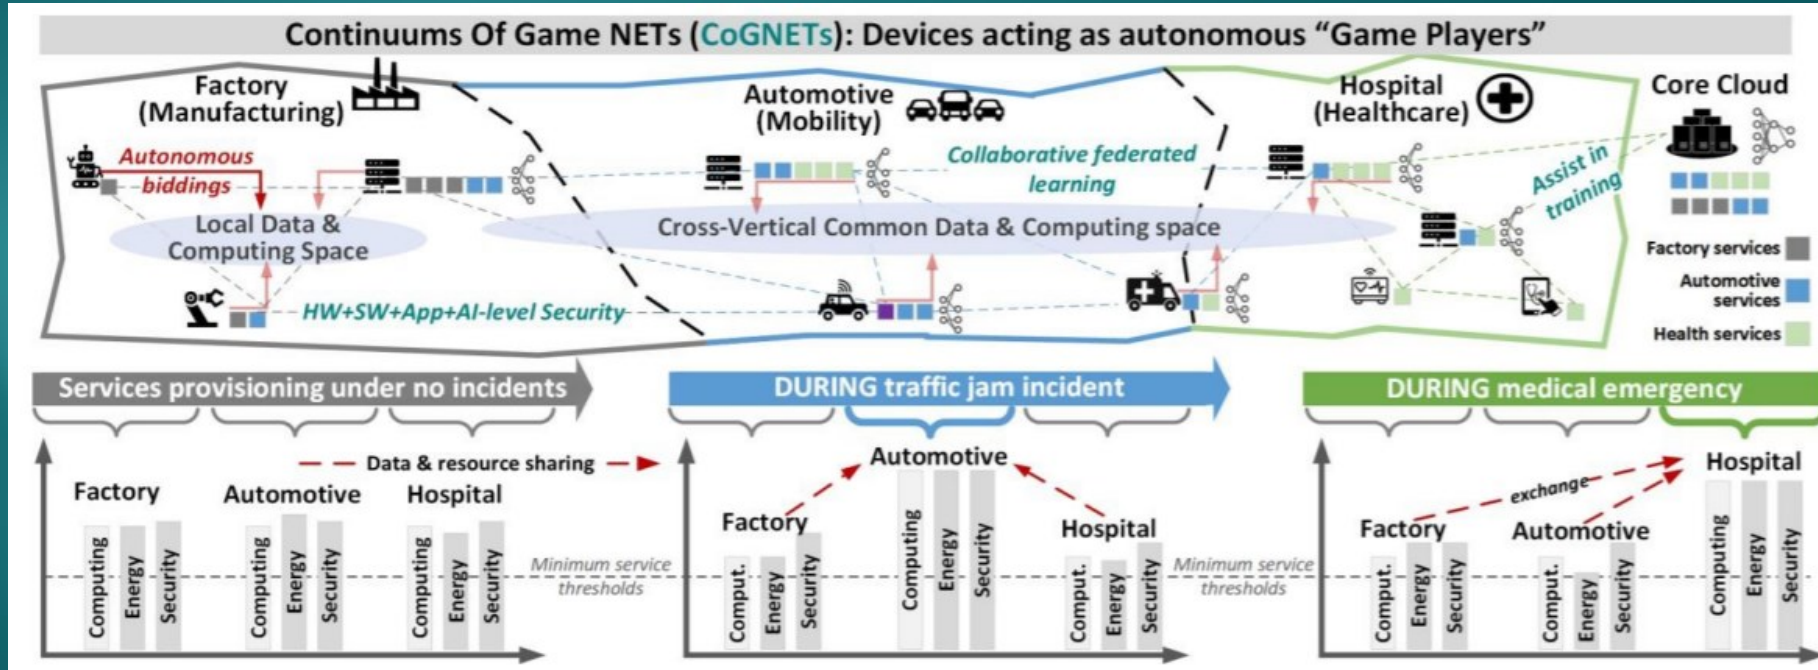

To fuse such game logic within the individual device and turn it into a cognitive resource, capable to **self-realizing** (or “Pricing”) its on-board data and resources, **self-organizing** (or “Bidding”) if, and how to utilize them within **common computing spaces** (or “Auctionings”), subject to the users’ service requests

Swarm continuums can be formed dynamically as results of the game play that will be running as a decentralized optimization process across all devices, and converge to mathematically precise Computing Equilibriums, i.e., “golden-states” where all services are maximized, while no data and resource is wasted

The games are designed to sensing and deciding for **additional heterogeneity dynamics** related to **cyber-risks, energy consumption, system faults**, offering more freedom with respect to the devices’ cognition for safeguarding the overall continuum’s cyber-resilience, digital-privacy, and energy-efficiency holistically

Concept

Ambition

- i. Novel autonomous design: Autonomous decision-making abilities to IoTs and Edge devices via competitive game strategies using stochastic analysis to enable asymmetric decentralizations of the control and reasoning of players
- ii. Future-proof distributed system architecture: A middleware architecture over multi-context broker and DDAG DLT model distribution functions with parameters to inject function instructions, thereby lightweighting the node management
- iii. Holistic Computing-vs-Energy-vs- Security optimization: A multi-dimensional KPI trade-offs optimization leading to a new regime of exploiting gains from such diversity
- iv. Pervasive heterogeneity perception via feature-based models: Heterogeneity models using feature-based techniques to capture each node's resources together with the extent that the node could be target of a successful attack or that it may fail due to defective circuit

Ambition

- v. Rapid service provisioning via collaborative federated learning: New Collaborative Federated Learning models will be developed, capable to split layers among IoT/Edge devices for rapid responsiveness and use the Cloud for training accuracy
- vi. End-to-end security embedded in all actions: New “*swarm-mode end-to-end security*” solutions will be adopted, combining both system and application-level security to strengthen cyber resilience and trustworthiness in highly distributed applications
- vii. Efficient data interoperability, sovereignty, and trust based on Open Standards: Open standard ETSI NGSI-LD APIs for real-time access to data, FIWARE Smart Data Models for effective data interoperability and exchange and decentralized components for data exchanges recording and storage in distributed ledgers will be adopted, to create service points accessing data across CEI continuum and to increase trustworthiness
- viii. Immersive productivity and Ethics compliance: A new layer will be introduced to use data locally making user-side applications intelligent, secure, and responsive and a human oriented IoT-to-Cloud solution that needs human-in-the-loop features will be developed

Thank you!
